## Introduction

- There has been abundant evidence showing the health benefits of a plant-based diet, such as reduced risks of obesity, cardiovascular disease, diabetes and malignancies.<sup>1-2</sup>
- Many physicians do not stress the importance these diets as an important aspect of chronic disease prevention and treatment.
- Pediatricians have an important role in dietary education of children, but there is scarce data focused specifically on pediatricians' knowledge regarding plant-based nutrition.<sup>3</sup>
- Our study assessed pediatrician's general nutritional knowledge and attitudes regarding whole food plant-based diets.

## Methods

A cross-sectional study was done using a previously implemented questionnaire that was distributed among a sample of pediatricians.

Survey was administered from January 2021 to October 2021. 117 participants responded to the survey.

Survey items were scored based on nutrition knowledge and attitudes toward plant-based diets, and then analyzed for mean scores.

## Results

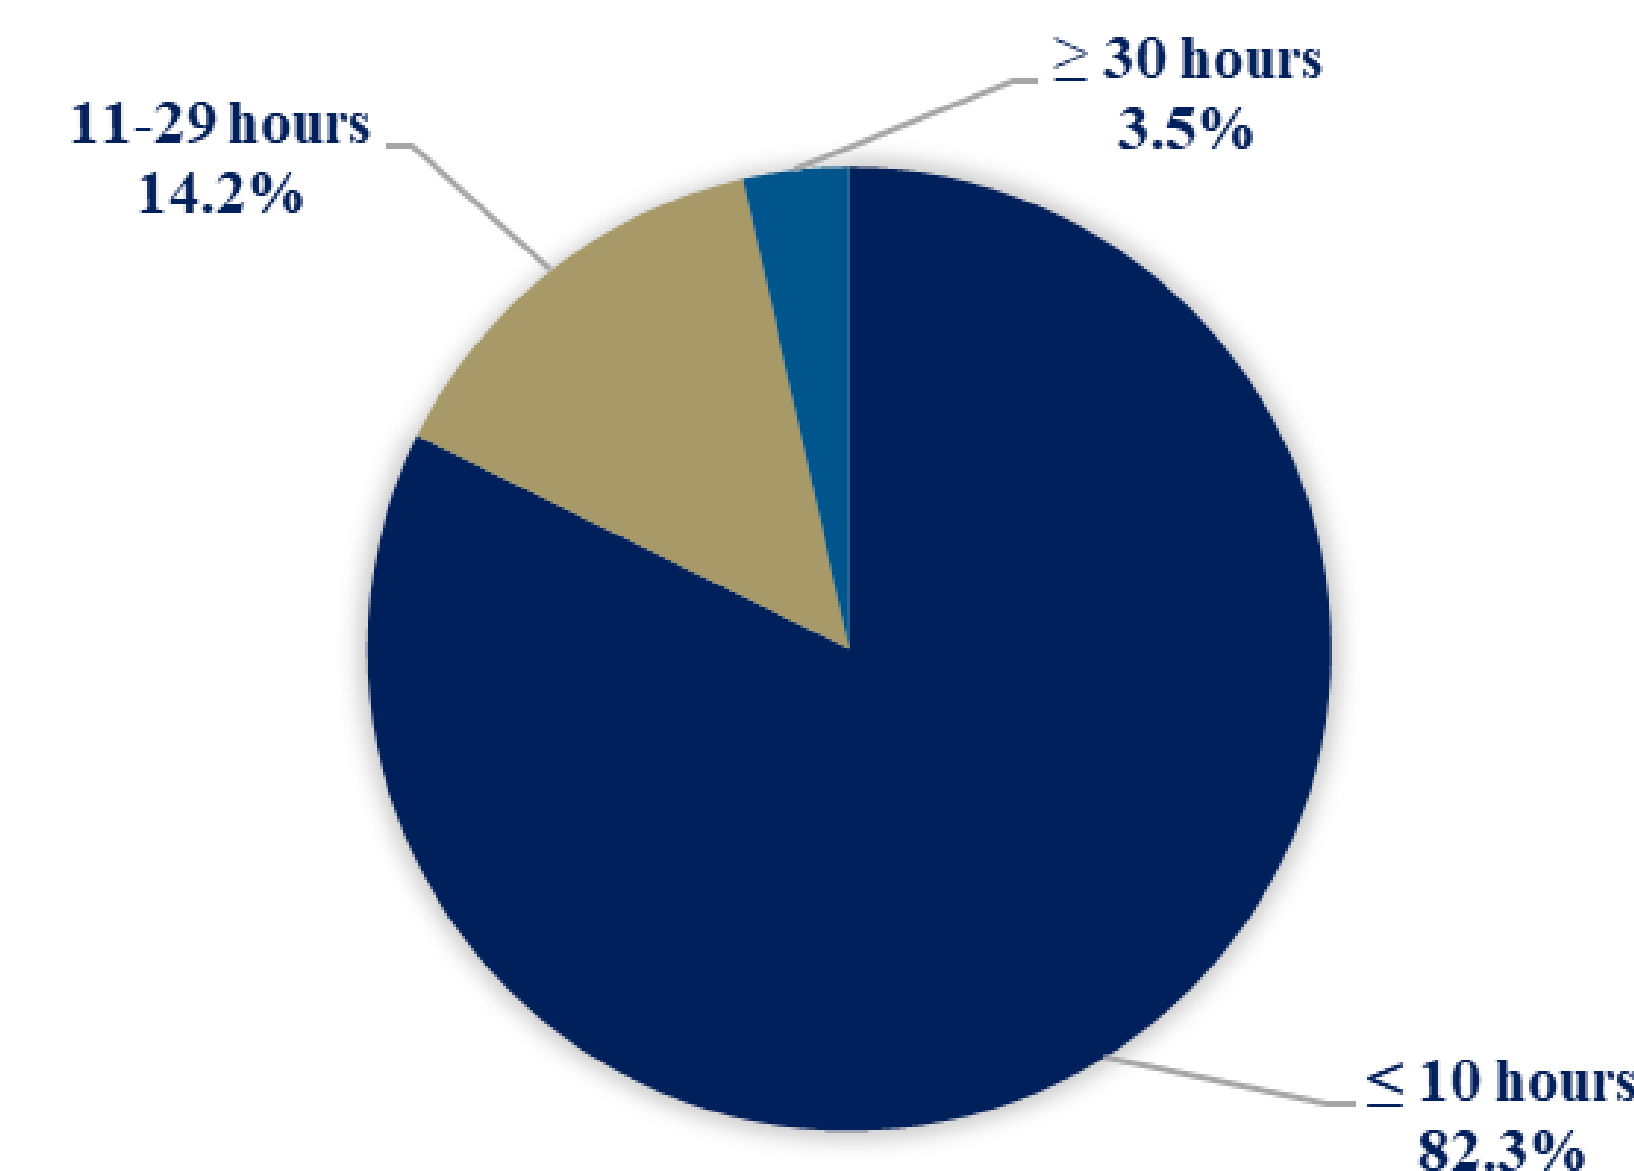

Table 1: Demographic characteristics of survey participants (n=117)

	Value
Age, median, range	42 years (24-75)
Caucasian race, %	90 (77.0%)
Female, %	90 (77.0%)
Have Children, %	73 (62.4%)
Pediatric Residents, %	44 (37.6%)
Following Plant-Based Diet*, %	65 (55.5%)

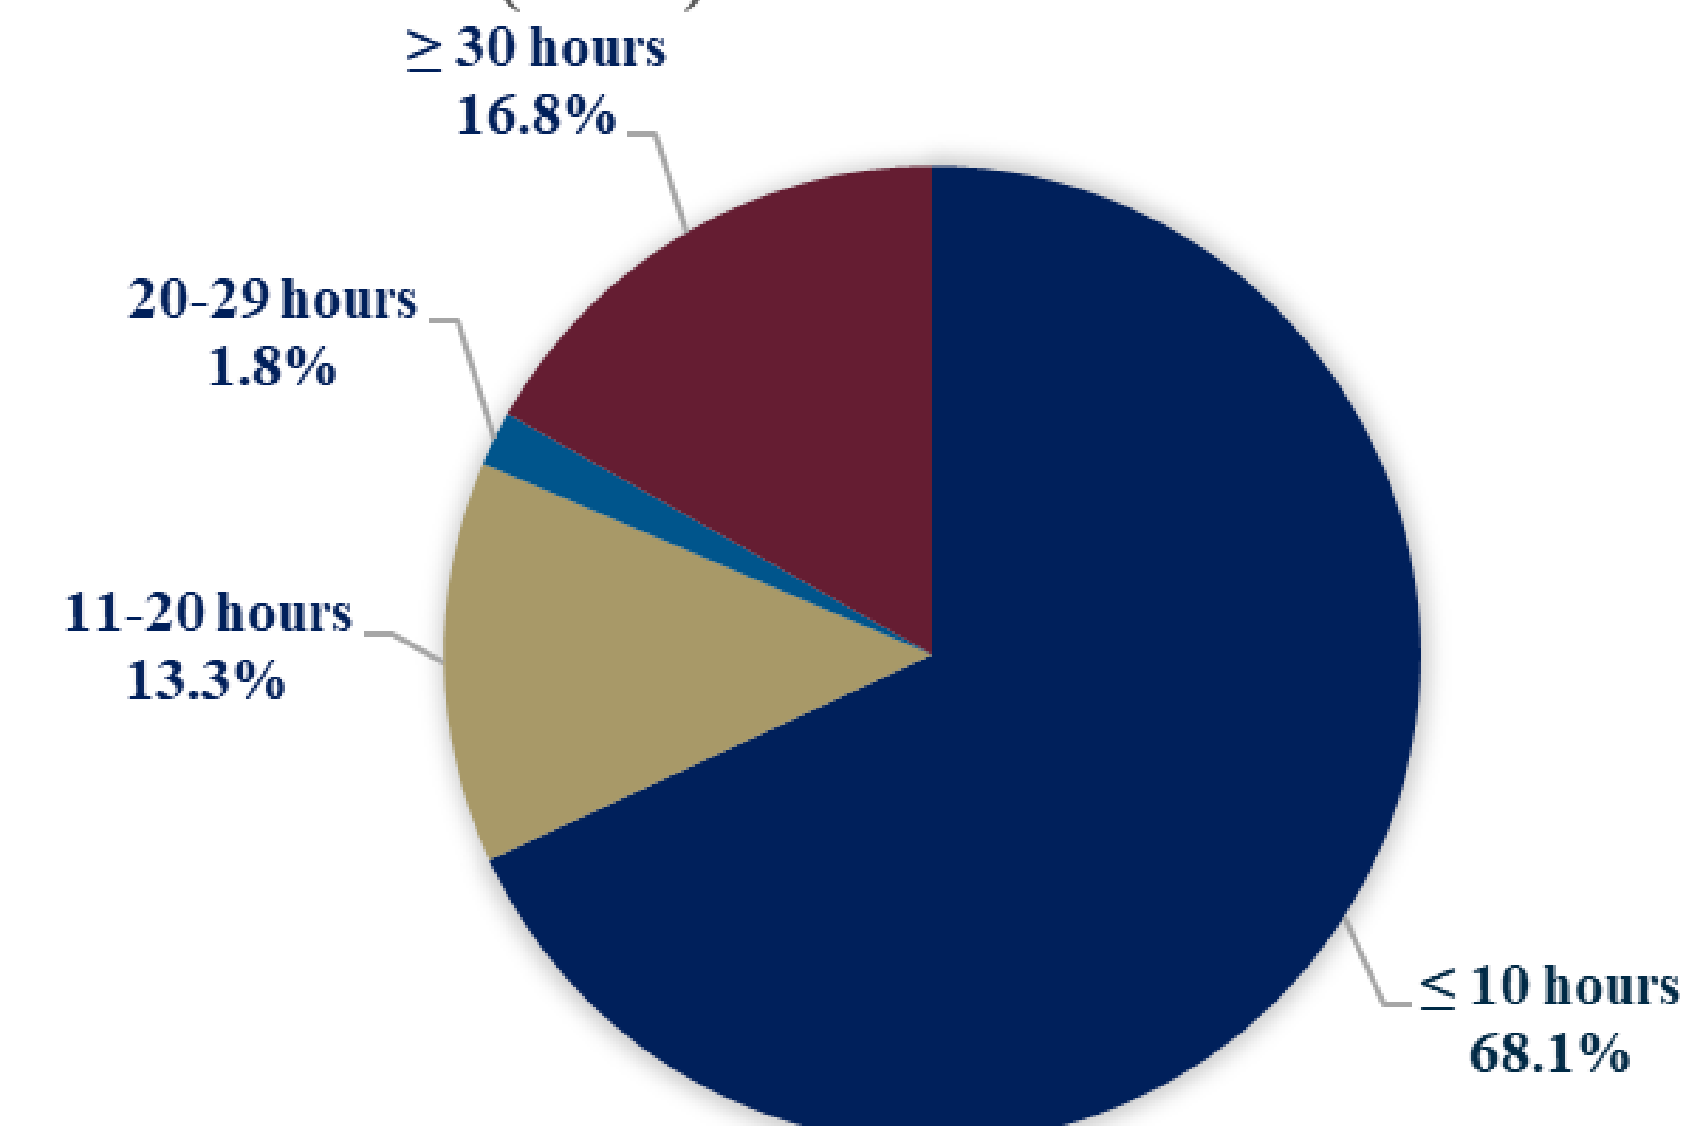

\* Plant-based diet means following a vegetarian, vegan or whole-food plant-based diet

Figure 1: Nutrition Education Received by Pediatricians in Medical School and Residency

NUTRITION EDUCATION HOURS RECEIVED IN MEDICAL SCHOOL

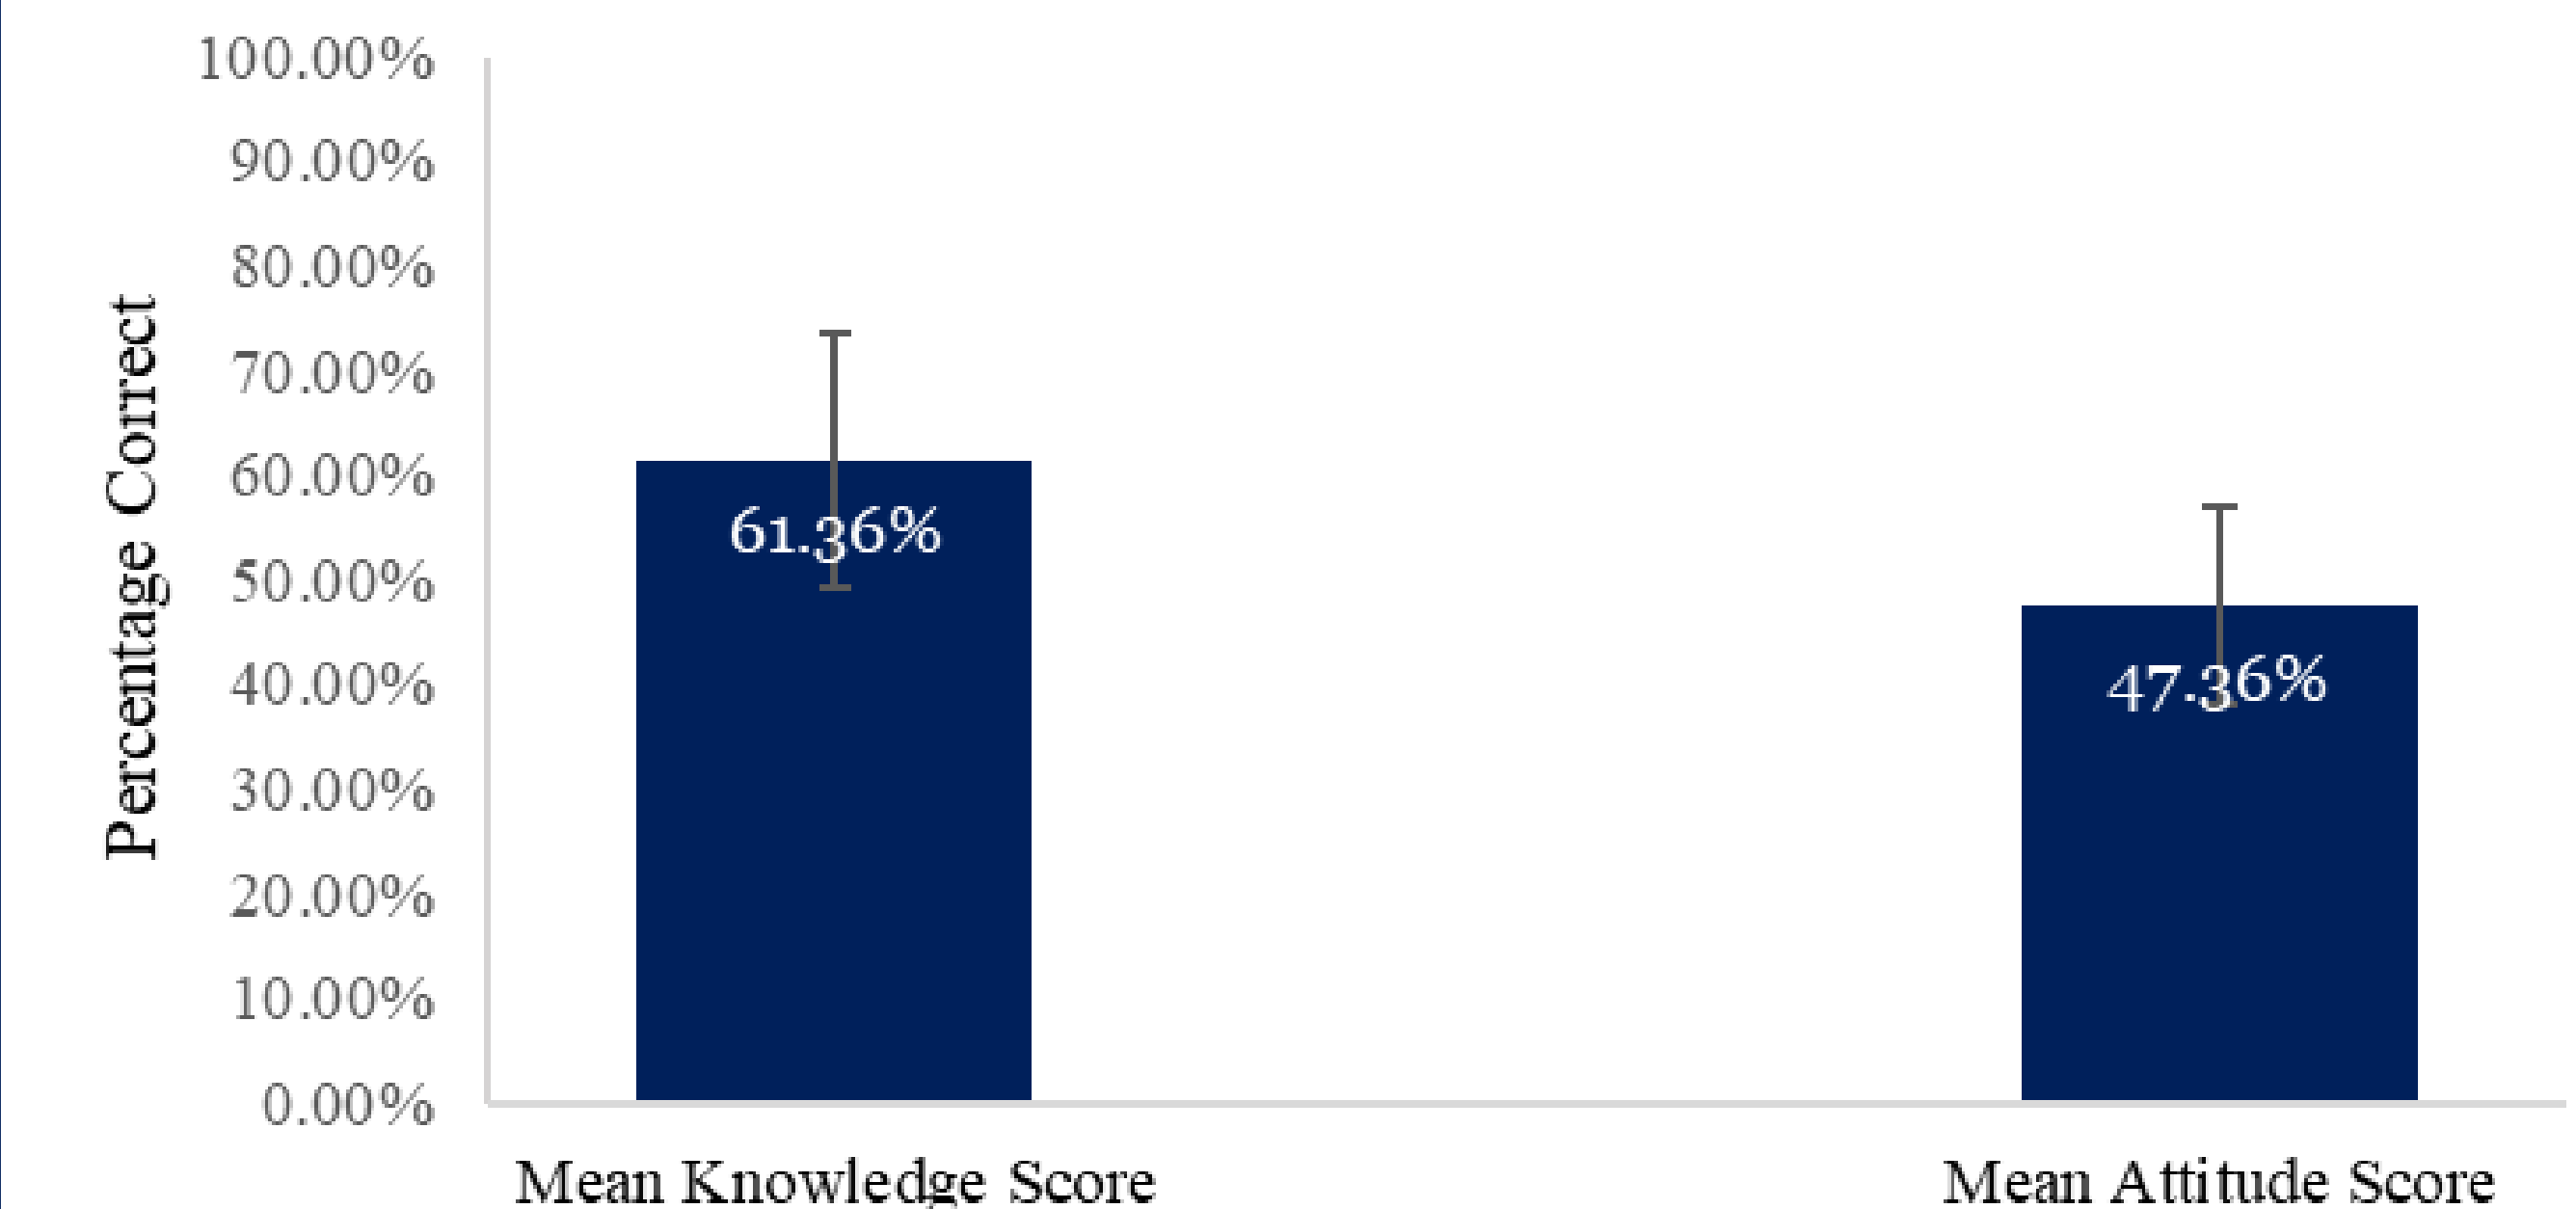

NUTRITION CONTINUING MEDICAL EDUCATION (CME) HOURS RECEIVED

Authors have no disclosures or funding to report.

Figure 2: Mean Knowledge and Attitude Scores Toward Plant-Based Diets

- Out of 10 knowledge questions, mean correct score for our participants was 61.36%. Out of 9 attitude questions, mean correct score for our participants was 47.36%.

## Conclusions

- Pediatricians are exposed to very little nutrition education hours during medical school and in their continued education training.
- A significant portion of pediatricians in our survey had low average knowledge base in vegetarian nutrition and did not hold positive attitudes concerning plant-based diets.
- Increasing education hours for pediatricians regarding plant-based diets may help them better counsel their patients on their dietary decisions.
